

The EASIEST way to drain your AMP of stored electricity.

Assuming your amp is working.....

With your amp running and you playing..... simply pull the power cord from wall!

But don't stop playing and leave your amp ON!

Keep playing while the notes or chords fizzle out.

This takes away enough voltage from the caps so that you won't get a BIG shock when working inside.

We read this somewhere and have tested the theory several times. This method usually takes your stored cap voltages down to less than 3 volts. Not enough to hurt anyone!

Of course we STILL hook up our jumper wires from Pin #1 on a preamp tube to ground and the Power and Standby switches ON to keep the caps from recharging while we are in there.

Remember – always be SAFE!
